

# CS 4530: Fundamentals of Software Engineering

## Module 3.7: React Hook Patterns

---

Adeel Bhutta and Mitch Wand  
Khoury College of Computer Sciences

# Learning Objectives for this Module

---

- By the end of this module, you should be able to:
  - Explain the basic use cases for useEffect
  - Explain when a useEffect is executed, and when its return value is executed
  - Construct simple custom hooks and explain why they are useful.
  - Be able to explain the three core steps of a test (assemble, act, assess) can map to UI component testing

# Lesson 9.1 useEffect

---

# useEffect is a mechanism for synchronizing a component with an external system

---

```
import { clockServer } from './clock.js';
```

```
function ClockClient() {
```

```
  useEffect(() => {  
    const connection = clockServer.createConnection()  
    connection.connect();
```

```
    return () => {  
      connection.disconnect();
```

```
    };  
  }, []);
```

```
  // ...
```

```
}
```

Action to take on first render

Action to take when component dismounts

Empty array says: do this on first render only

<https://react.dev/reference/react/useEffect>

# An external system means any piece of code that's not inside your React component

---

- An event in the lifecycle of a component, like `render`.
- A timer managed with `setInterval` and `clearInterval`
- An event subscription like a chat server
- A call to fetch data from an external web site
- An external animation library
- A piece of business logic in an app that is external to your component

# A real example: a display that connects to a self-ticking clock

src/app/Components/SimpleClockDisplay.tsx

```
export default function ClockDisplay(props: {
  name: string, key: number,
  clock: IClock,
  handleDelete: () => void,
  handleAdd: () => void,
}) {
  {
    const [localTime, setLocalTime] = useState(0)
    const incrementLocalTime = () => setLocalTime(localTime => localTime + 1)
    const clock = props.clock

    useEffect(() => {
      const listener1 = () => { incrementLocalTime() }
      clock.addListener(listener1)
      return () => {
        clock.removeListener(listener1)
      }
    }, [])
```

The parent provides the clock

On first render, add this listener to the clock

On dismount, remove the listener.

Display logic will come later...

# Our app will have three displays of the clock

```
import * as React from 'react'; import { useState } from 'react';
import ClockDisplay from '../../Components/ClockDisplay'
import SingletonClock from '../../Classes/SingletonClockFactory'
function doNothing() { }
```

```
export default function App() {
  const [clock, _] = useState(SingletonClock.getInstance(1000));
```

```
  return (
    <VStack>
      <ClockDisplay key={1} name={"Clock A"} clock={clock}
        handleAdd={doNothing} handleDelete={doNothing}
      />
      <ClockDisplay key={2} name={"Clock B"} clock={clock}
        handleAdd={doNothing} handleDelete={doNothing}
      />
      <ClockDisplay key={3} name={"Clock C"} clock={clock}
        handleAdd={doNothing} handleDelete={doNothing}
      />
    </VStack>
  );
}
```

# Next, let's look at the clock

```
type Listener = () => void
```

```
class Clock implements IClock{  
    private _listeners: Listener[] = []  
    private _notifyAll() {this._listeners  
        .forEach(eachListener => {eachListener()})}  
  
    public addListener(listener: Listener) {---}  
    public removeListener(listener: Listener) {---}  
  
    get nListeners () {return this._listeners.length}  
  
    private _timer : NodeJS.Timeout  
    private _interval : number  
    public id : string  
  
    public constructor(interval: number) {  
        this.id = nanoid(4)  
        this._interval = interval;  
        this.start()  
    }  
}
```

```
    public start() {  
        console.log(`Clock ${this.id} starting`)  
        this._timer = setInterval(() => {  
            this._tick();  
        }, this._interval);  
    }  
  
    private _tick() {  
        this._notifyAll();  
    }  
  
    public stop() {  
        console.log(`Clock ${this.id} stopping`)  
        clearInterval(this._timer);  
    }  
}
```

# We'll make the clock a singleton in the usual way

src/Classes/SingletonClockFactory.ts

```
export default class SingletonClockFactory {  
  
    private static theClock: Clock | undefined = undefined  
  
    private constructor () {SingletonClockFactory.theClock = undefined}  
  
    public static instance (interval:number) : Clock {  
        if (SingletonClockFactory.theClock === undefined) {  
            SingletonClockFactory.theClock = new Clock(interval)  
        }  
        return SingletonClockFactory.theClock  
    }  
}
```

# Let's look at <ClockDisplay> again

```
export default function ClockDisplay(props: {
  name: string; key: number; clock: IClock;
  handleDelete: () => void; handleAdd: () => void;
}): JSX.Element {
  const [localTime, setLocalTime] = useState(0);
  const incrementLocalTime = () => { setLocalTime((localTime) => localTime + 1); };

  const listener1 = () => { incrementLocalTime(); };
  const clock = props.clock;

  useEffect(() => {
    clock.addListener(listener1);
    console.log(`ClockDisplay ${props.name} is mounting`);
    return () => {
      console.log("ClockDisplay " + props.name + " is unmounting");
      clock.removeListener(listener1);
    };
  }, []);
}
```

business logic

# ClockDisplay, part 2: the display logic

```
function handleStop() { clock.stop(); }  
function handleStart() { clock.start(); }
```

```
return (  
  <HStack>  
    <Box>Clock: {props.name}</Box>  
    <Box>Clock ID: {clock.id} </Box>  
    <Box>Time = {localTime}</Box>  
    <Box>nlisteners = {clock.nListeners}</Box>  
    <Button aria-label={"start"} onClick={handleStart}>Start</Button>  
    <Button aria-label={"stop"} onClick={handleStop}>Stop</Button>  
    <IconButton aria-label={"delete"} onClick={props.handleDelete}  
      icon={<AiOutlineDelete />}  
    />  
    <IconButton aria-label={"add"} onClick={props.handleAdd}  
      icon={<AiOutlinePlus />}  
    />  
  </HStack>  
>);
```

display logic

Clock: Clock A Time = 11 nlisteners = 3

Clock: Clock B Time = 11 nlisteners = 3

Clock: Clock C Time = 11 nlisteners = 3

ClockDisplay Clock B is mounting [SimpleClockDisplay.tsx:24](#)

ClockDisplay Clock C is mounting [SimpleClockDisplay.tsx:24](#)

# useEffect's Dependencies Control Its Execution

---

- `useEffect` takes an optional array of dependencies
- The effect is only executed if one or more of the values in the dependency change (e.g. by a setter)
- Special Cases:
  - `[]` means run only on first render
  - No argument means run on every render

# Example (Part 1)

```
export default function App() {  
  const [n, setN] = useState(0)  
  const [m, setM] = useState(0)  
  
  // runs only on first render.  
  useEffect(() => {  
    console.log('useEffect #1 is run only on first render')}, [])  
  
  useEffect(() => {  
    console.log('useEffect #2N is run only when n changes')}, [n])  
  
  useEffect(() => {  
    console.log('useEffect #2M is run when m changes')}, [m])  
  
  useEffect(() => {  
    console.log('useEffect #2MN is run when m or n changes')  
  }, [m,n])  
  
  // runs on every render  
  useEffect(() => {  
    console.log('useEffect #3 is called on every render')})  
  
  // observe that effects run in order of definition
```

# Example (part 2)

---

```
function onClickN() {
  console.log('Clicked n!');
  setN(n => n + 1);
}

function onClickM() {
  console.log('Clicked m!');
  setM(m => m + 1);
}

return (
  <VStack>
    <Heading>useEffect demo #1</Heading>
    <Text> n is {n} </Text>
    <Button onClick={onClickN}>Increment n</Button>
    <Text> m is {m} </Text>
    <Button onClick={onClickM}>Increment m</Button>
  </VStack>
)
```

# Demo

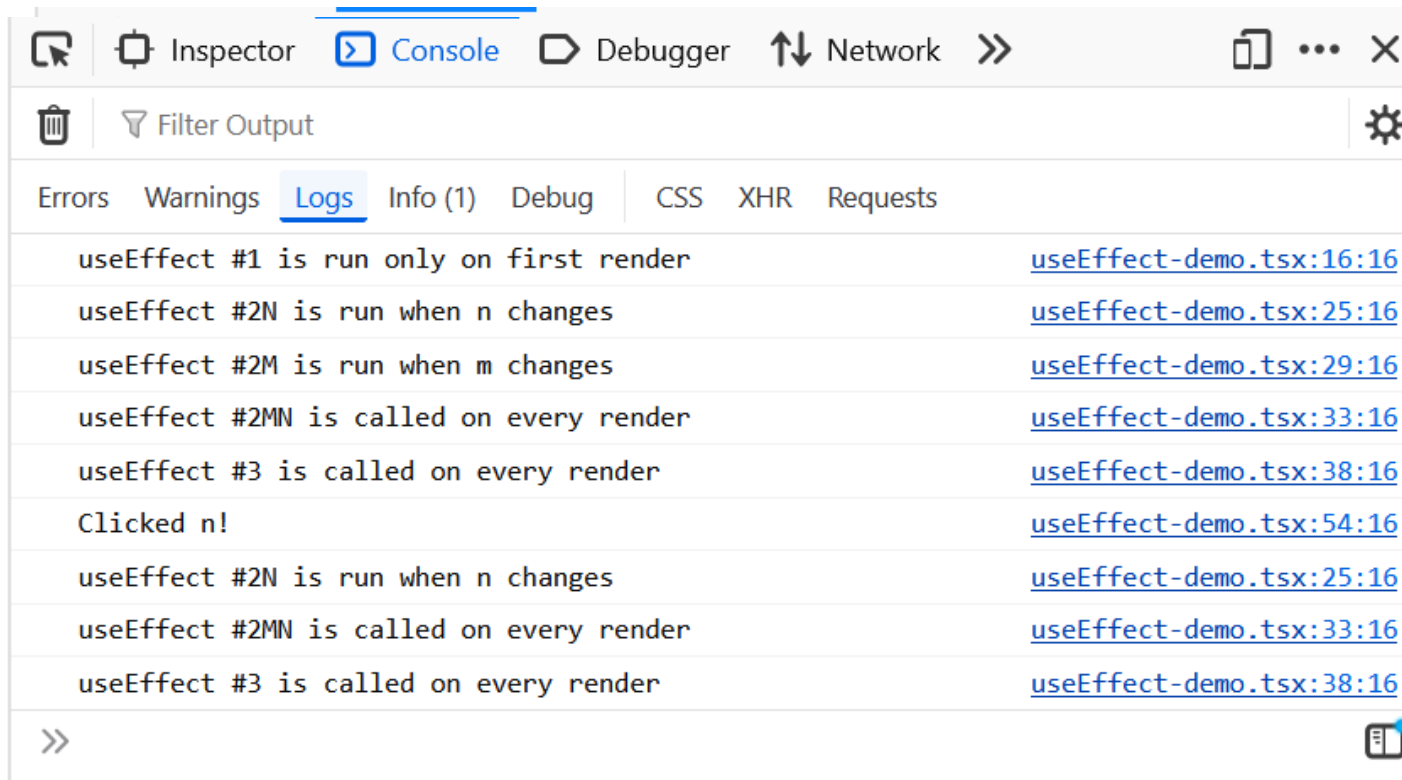

## useEffect demo #1

n is 1

Increment n

m is 0

Increment m

The screenshot shows the Chrome DevTools Console with the 'Console' tab selected. The 'Filter Output' dropdown is set to 'Filter Output'. The 'Logs' tab is active, showing a list of log entries. The entries are as follows:

Log Entry	Source
useEffect #1 is run only on first render	<a href="#">useEffect-demo.tsx:16:16</a>
useEffect #2N is run when n changes	<a href="#">useEffect-demo.tsx:25:16</a>
useEffect #2M is run when m changes	<a href="#">useEffect-demo.tsx:29:16</a>
useEffect #2MN is called on every render	<a href="#">useEffect-demo.tsx:33:16</a>
useEffect #3 is called on every render	<a href="#">useEffect-demo.tsx:38:16</a>
Clicked n!	<a href="#">useEffect-demo.tsx:54:16</a>
useEffect #2N is run when n changes	<a href="#">useEffect-demo.tsx:25:16</a>
useEffect #2MN is called on every render	<a href="#">useEffect-demo.tsx:33:16</a>
useEffect #3 is called on every render	<a href="#">useEffect-demo.tsx:38:16</a>

The console also shows a 'Clicked n!' message. The bottom of the console has a 'Filter Output' dropdown and a 'Filter Output' button.

# When is the cleanup function executed?

---

- In general, the cleanup function is executed sometime before the next time the hook is run.
- For the first-time-only case, this means when the component is dismantled.
- Let's look at useEffect demo again, this time with noisy cleanups.

```
function cleanup(message: string) {return () => {console.log('cleanup: ' + message)}}

export default function App() {
  const [n, setN] = useState(0)
  const [m, setM] = useState(0)

  useEffect(() => {
    console.log('useEffect #1 is run only on first render')
    return cleanup('useEffect #1')
  }, [])

  useEffect(() => {
    console.log('useEffect #2N is run only when n changes')
    return cleanup('useEffect #2N')
  }, [n])

  ... // other effects
```

## useEffect demo with CleanUps

n is 1

Increment n

m is 0

Increment m

## Lesson 9.2 Custom Hooks

---

# Custom Hooks

---

- REACT lets us combine `useState` and `useEffect` to build custom hooks.
- Custom Hooks let us separate business logic from display logic

# Example: useClock

---

```
export function useClock (listener1: () => void) : IClock {  
  const clock = SingletonClockFactory.getInstance(1000)  
  useEffect(() => {  
    clock.addListener(listener1)  
    return () => {  
      clock.removeListener(listener1)  
    }  
  }, []);  
  return clock  
}
```

# Using useClock

```
import { useClock } from '../Hooks/useClock';

export function ClockDisplay(props: {
  name: string, key: number,
  handleDelete: () => void, handleAdd: () => void,
  noisyDelete?: boolean
}) {
  const [localTime, setLocalTime] = useState(0)
  const incrementLocalTime = () => setLocalTime(localTime => localTime + 1)
  const clock:IClock = useClock(incrementLocalTime)

  return (
    <HStack>
      <Box>Clock: {props.name}</Box>
      <Box>Time = {localTime}</Box>
      <Box>nlisteners = {clock.nListeners}</Box>
      <IconButton aria-label={'delete'} onClick={props.handleDelete} icon={<AiOutlineDelete />} />
      <IconButton aria-label={'add'} onClick={props.handleAdd} icon={<AiOutlinePlus />} />
    </HStack>
  )
}
```

# A somewhat larger example: ToDoList

```
export default function ToDoApp () {  
  const [todoList, setTodolist] = useState<ToDoItem[]>([])  
  const [itemKey, setItemKey] = useState<number>(0) // first unused key  
  
  function handleAdd (title:string, priority:string) {  
    if (title === '') {return} // ignore blank button presses  
    setTodolist(todoList.concat({title: title, priority: priority, key: itemKey}))  
    setItemKey(itemKey + 1)  
  }  
  
  function handleDelete(targetKey:number) {  
    const newList = todoList.filter(item => item.key !== targetKey)  
    setTodolist(newList)  
  }  
  
  return (  
    <VStack>  
      <Heading>TODO List</Heading>  
      <ToDoItemEntryForm onAdd={handleAdd}/>  
      <ToDoListDisplay items={todoList} onDelete={handleDelete}/>  
    </VStack>  
  )  
}
```

business logic

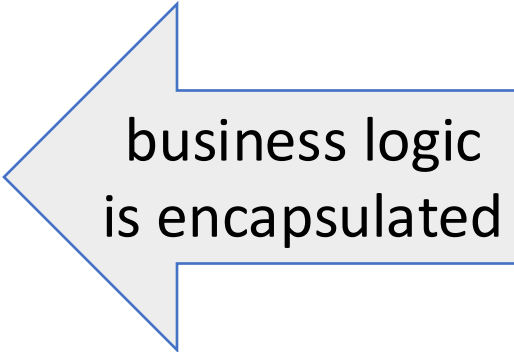

display logic

# Refactoring ToDoList

```
export default function ToDoApp () {  
  
  const {todoList, handleAdd, handleDelete} = useToDoItemList()  
  
  return (  
    <VStack>  
      <Heading>TODO List</Heading>  
      <ToDoItemEntryForm onAdd={handleAdd}/>  
      <ToDoListDisplay items={todoList} onDelete={handleDelete}/>  
    </VStack>  
  )  
}
```

business logic  
is encapsulated

# The hook encapsulates the business logic

```
export default function useToDoItemList () {  
  const [todoList, setTodolist] = useState<ToDoItem[]>([])  
  const [itemKey, setItemKey] = useState<number>(0) // first unused key  
  
  function handleAdd (title:string, priority:string) {  
    if (title === '') {return} // ignore blank button presses  
    setTodolist(todoList.concat({title: title, priority: priority, key: itemKey}))  
    setItemKey(itemKey + 1)  
  }  
  
  function handleDelete(targetKey:number) {  
    const newList = todoList.filter(item => item.key !== targetKey)  
    setTodolist(newList)  
  }  
  
  return {todoList: todoList, handleAdd: handleAdd, handleDelete: handleDelete}  
}
```

# The hook is like a class managing a piece of state

---

```
export default function useToDoItemList () {  
  const [todoList, setTodolist] = useState<ToDoItem[]>([])  
  const [itemKey, setItemKey] = useState<number>(0) // first unused key  
  
  function handleAdd (title:string, priority:string) {  
    if (title === '') {return} // ignore blank button presses  
    setTodolist(todoList.concat({title: title, priority: priority, key: itemKey}))  
    setItemKey(itemKey + 1)  
  }  
  
  function handleDelete(targetKey:number) {  
    const newList = todoList.filter(item => item.key !== targetKey)  
    setTodolist(newList)  
  }  
  
  return {todoList: todoList, handleAdd: handleAdd, handleDelete: handleDelete}  
}
```

handleAdd and handleDelete  
are the only methods for  
manipulating the state

# The hook's state becomes part of its user's state.

---

```
export default function useToDoItemList () {  
  const [todoList, setTodolist] = useState<ToDoItem[]>([])  
  const [itemKey, setItemKey] = useState<number>(0) // first unused key  
  
  function handleAdd (title:string, priority:string) {  
    if (title === '') {return} // ignore blank button presses  
    setTodolist(todoList.concat({title: title, priority: priority, key: itemKey}))  
    setItemKey(itemKey + 1)  
  }  
  
  function handleDelete(targetKey:number) {  
    const newList = todoList.filter(item => item.key !== targetKey)  
    setTodolist(newList)  
  }  
  
  return {todoList: todoList, handleAdd: handleAdd, handleDelete: handleDelete}  
}
```

calling these setters redisplay  
the whole component

# The Rules of Hooks

---

## 1. Only call hooks at the top level

- Not within loops, inside conditions, or nested functions
- Rationale: The order of hooks called must always be the same each time a component renders

## 2. Only call hooks from React Components or Custom Hooks

- Not from any other helper methods or classes
- Rationale: React must know the component that the call to the hook is associated with

```
export function LikeButton() {  
  const [isLiked, setIsLiked] = useState(false);  
  const [count, setCount] = useState(0);  
  ...  
}
```

React knows which `useState` is which by tracking calls to them from components in the render tree

# We Use Two ESLint Rules for React Hooks

---

- You should not violate the rules of hooks. These linter plugins help detect violations
- React-hooks/rules-of-hooks
  - Enforces that hooks are only called from React functional components or custom hooks
- React-hooks/exhaustive-deps
  - Enforces that all variables used in useEffects are included as dependencies

## Lesson 9.3 Testing your REACT components

---

# Testing React components

---

- The AAA pattern ("Assemble/Act/Assess") still applies
- Need a test double for the React system
  - render components into a "virtual dom" or into a captive web browser
- The FakeStackOverflow codebase uses Cypress, a popular tool for end-to-end testing.

"Testing Library" <https://testing-library.com> is another test system for React. It is compatible with many UI libraries and many testing frameworks

<https://docs.cypress.io/guides/end-to-end-testing/writing-your-first-end-to-end-test>

# Cypress commands work on a "virtual DOM"

---

<code>.visit()</code>	Visit a remote URL. Many tests begin with this command.
<code>.contains()</code>	Select a DOM element by text content.
<code>.get()</code>	Find DOM elements by selector
<code>.click()</code>	Click a DOM element.
<code>.type()</code>	Type into a DOM element.

These will fail if the specified element does not exist

# Recall: Most tests are in AAA form: Assemble/Act/Assess

---

```
test('addStudent should add a student to the database', () => {  
  // const db = new DataBase ()  
  expect(db.nameToIDs('blair')).toEqual([])  
  
  const id1 = db.addStudent('blair');  
  
  expect(db.nameToIDs('blair')).toEqual([id1])  
});
```

The diagram illustrates the AAA (Assemble/Act/Assess) test structure. It shows a code snippet with three main parts, each highlighted by a green callout box with a red arrow pointing to the corresponding code line:

- Assemble (and check that you've assembled it)**: Points to the first `expect` statement: `expect(db.nameToIDs('blair')).toEqual([])`.
- Act (do the action that you are trying to test)**: Points to the `const id1 = db.addStudent('blair');` line.
- Assess: check to see that the response is correct**: Points to the second `expect` statement: `expect(db.nameToIDs('blair')).toEqual([id1])`.

# A typical cypress test

```
it("5.1 | Created new answer should be displayed at the top of the answers page",  
  () => {  
    const answers = [  
      "Test Answer 1",  
      A1_TXT,  
      A2_TXT,  
    ];  
    cy.visit("http://localhost:3000");  
    cy.contains(Q1_DESC).click();  
    cy.contains("Answer Question").click();  
    cy.get("#answerUsernameInput").type("joym");  
    cy.get("#answerTextInput").type(answers[0]);  
    cy.contains("Post Answer").click();  
    cy.get(".answerText").each(($el, index) => {  
      cy.contains(answers[index]);  
    });  
    cy.contains("joym");  
    cy.contains("0 seconds ago");  
  });
```

Assemble (and check that  
you've assembled it  
correctly)

Act (do the action that  
you are trying to test)

Assess: check to see that  
the response is correct

run with: npx cypress run

# Learning Objectives for this Lesson

---

- By the end of this lesson, you should be able to:
  - Explain the basic use cases for useEffect
  - Explain when a useEffect is executed, and when its return value is executed
  - Construct simple custom hooks and explain why they are useful.
  - Be able to explain the three core steps of a test (assemble, act, assess) can map to UI component testing
